Hi Andrew, Jenni,

This works for me!

Susan

(that will be the majority of the CRUD operations).

Here's what I would like to clear with you, I am also taking CSCI E-60, Web Based Database Applications and would like to use some of the same tables in my final projects for both classes. I think they would be separate enough, as the project for CSCI E-60 must be written in Oracle ps/sql with a ColdFusion interface. I'm envisioning this as more a backend database management for all the league's data for use by the board (it would include all the data for players, coaches, parents etc with capability to modify all records and generate reports such as email lists, enrollment and such). This project would use some of the same basic tables, but would need to be rewritten in MySQL and used for the public facing website.

I've already cleared this with the CSCI E-60 instructor (I'm attaching that email as a WordDoc in case you want to see it) and wanted to get your ok before beginning to write up my proposals for each class. Just want to cover all my bases on the Academic Integrity side of things.

Thanks,
Andrew Bielecki
